

# Login to the application section of the cloud without cloud account

## Problem

In clouds with external authentication enabled any domain account will be able to login to the cloudname.app.perfectomobile.com site. This gives the users access to the Interactive and codeless UI besides the reporting section of the site which will enable user to consume licenses for web cradles. In the "livestream" tab users in interactive sessions will be visible, despite the fact they are not existing the cloud site administration:

Name	Owner	Time		Now running on					
		Start	Duration	Device model	OS	Browser	Resolution	M	
<input type="checkbox"/> RemoteWebDriver	[Redacted]	07:03:59	47s 241ms	Apple iPhone-X	Apple 12.0.1		1125x2436		
<input type="checkbox"/> RemoteWebDriver	[Redacted]	07:03:18	1m 28s 13ms	Google Pixel XL	Android 7.1.1		1440x2560		
<input type="checkbox"/> Interactive session	[Redacted]	05:42:09	1h 22m 37s	Windows VM	Windows 10	67	1920x1080		
<input type="checkbox"/> Interactive session	[Redacted]	04:27:56	2h 36m 50s	Windows VM	Windows 10	beta	1024x768		

The user in the bottom is not part of the system administration's Users tab.

## Solution

The customers' local IDP (Identity Provider) should be configured to restrict access to the URL of the cloud. Any user attempting to login with a functional domain account will be able to do so and access this portion of the cloud.

The security team on the customers's side should be engaged to allow/restrict access to the cloud URL in order to control the usage of the site.

Working in the flash UI will require the user to have account in System Administration.
