

# Quantum Test Not Running in Eclipse

## Problem

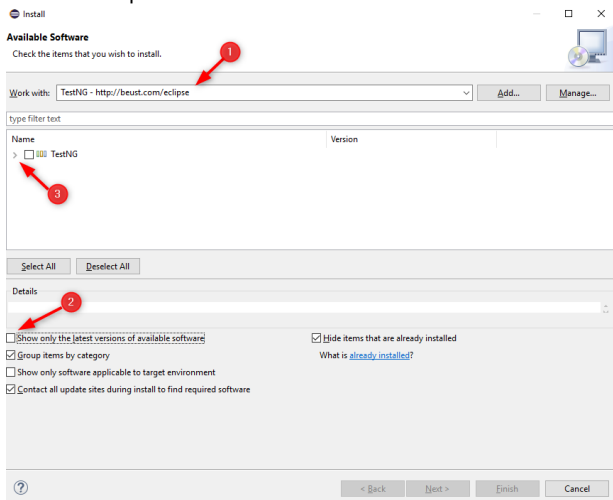

Quantum test run in Eclipse shuts down as soon as it's kicked off.

## Solution

The issue is caused by the Quantum POM file pointing to a specific TestNG version while your Eclipse has a different TestNG version installed.

Install the matching TestNG version as follows to resolve the issue:

1. Go to Help Install New Software
2. In the Software Installation window, enter the URL <http://beust.com/eclipse>
3. Uncheck option "Show only the latest versions of available software"
4. Expand TestNG for the list of available versions, then select the specific TestNG version matching the one listed in your POM file
5. Click Next to proceed with the installation

6. Once the installation has completed, restart Eclipse
