

Capturing screen shots using Appium

The following code sample uses the driver's `getScreenshotAs` method that captures a screenshot of the device and then `FileUtils.copyFile` to copy the screenshot to a local file.

```
File file = ((TakesScreenshot)driver).getScreenshotAs(OutputType.FILE);
FileUtils.copyFile(file, new File("Screenshot.jpg"));
```

On running this code, you will find a `Screenshot.jpg` file in the root folder of your Appium project. You can also specify a directory of your choice as the `copyFile` method's parameter, for example:

```
File file = ((TakesScreenshot)driver).getScreenshotAs(OutputType.FILE);
FileUtils.copyFile(file, new File("C:/temp/Screenshot.jpg"));
```
